

## JavaScript Comment

Create a comment component to match the provided mock. All data in the comment should be pulled from JavaScript. You may replace the user image with an image of your choice.

## Requirements:

- It should visually match the mock
- Include a readme
- Include tests
- All data should be separated from the template
- The “reply”, “{n} replies”, and up/down arrow counts are each interactive elements (they do not need to function, but should be coded as interactive elements)
- When the *entire comment* is hovered, the light-grey items (“reply”, “{n} replies”, and up/down arrows with counts) should become visibly darker

Upload your project as a public repo on github and send us the link to access it. Please try to complete it within about a week.

Please confirm that you have received this email, and let us know roughly when we can expect your submission.
